◆ **Suitable Data format for the CLT-xxx(N) Series ;**

The circuit of the CLT -xxx (N) series is designed in that way that unexpected output pulses due to noise or disturbance signals are avoided. A band pass filter, an integrator stage and an automatic gain control are used to suppress such disturbances.

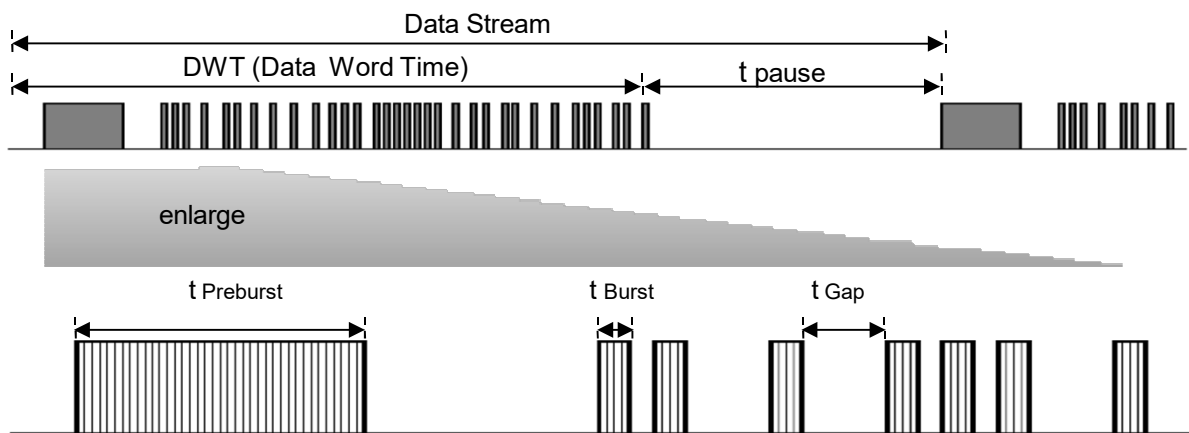

The distinguishing mark between data signal (not suppressed) and disturbance signal (suppressed) are carrier frequency, burst length and Signal Gap Time (see diagram below).

➤ The data signal should full-fill the following condition :  
Carrier frequency should be close to center frequency of the band-pass filter.

➤ Some examples for suitable data format are :  
NEC , RC5/6, Toshiba , Sony12bit , Matsushita , Mitsubishi Code.  
( Sony15/20 bit ,RCA, RCMM Code is not Recommend. )

Item	Symbol	Time
Minimum Burst length	tBurst	Min. 300us
Minimum Gap Time	tGap	Min. 350us
Minimum data pause time	tPause	Min. 23ms
Required data pause time	tPause	> (DWT/3) + 18.5ms

[ Fig. 9 ] Data Signal diagram

- t Burst ; length of a burst in pulses of the carrier frequency.
- t Gap ; length of the gap between two burst in pulses of carrier.
- t pause ; length of the pause between two data words.
- tPreburst ; lead code of data word

◆ **Disturbance Suppression**

When a disturbance signal is applied to the CLT-xxx(N) series. it can still receive the data signal. However the sensitivity is reduced to that level that no unexpected pulses will occurrence.

Some examples for such disturbance signals which are suppressed by the CLT-xxx(N) series are :

Signals from fluorescent lamps with electronic ballast with high or low modulation.

Continuous signal at 38 kHz or at any other frequency,

DC light (from tungsten bulb or sunlight)

◆ **External Application Circuit - Power Noise reduction & ESD Protection**

A further influence to the IR receiver modules may come from a supply voltage which is not stable. Such a disturbed supply voltage can be caused by switching power supply.

which is not filtered well or by other components in the circuit which produced spikes on the supply line.

This disturbed supply will reduce the sensitivity of receiver modules.

This application circuit will filter the disturbed supply voltage.
